Y11 Mock Exam January 2011

Model Answers

Lurgan College Mock Examinations 2011

Geography

Unit 1: Understanding our Natural World

Year 11 Mock Exam

January 2011

Time: 60 minutes
Total marks: 60
Write all your answers in the spaces provided in the question paper.

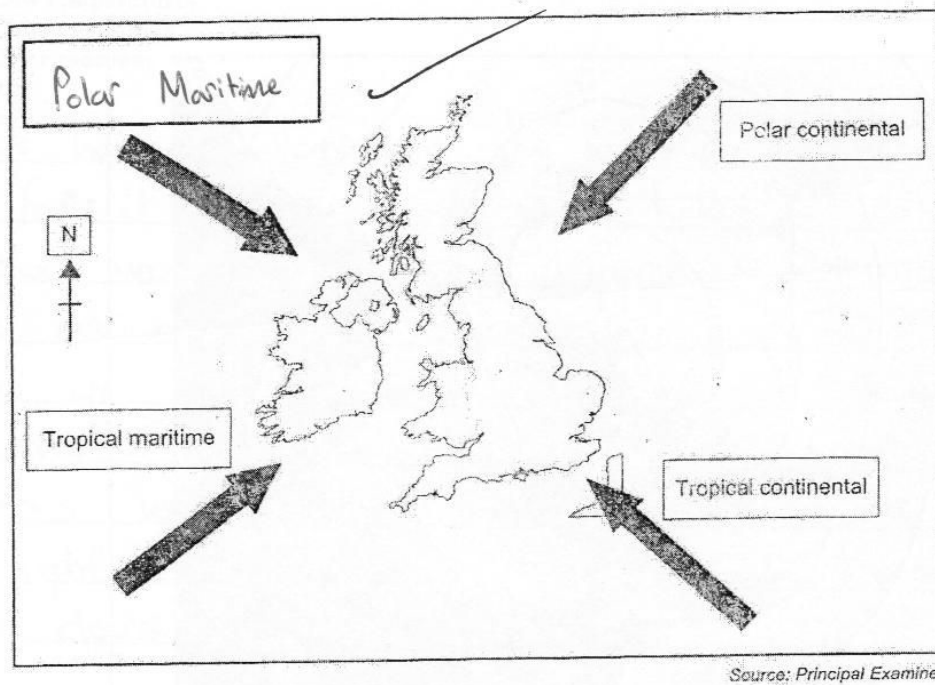

Answer all questions
Your Name: _____
Teacher: Mr Hamill / Mr Ross / Mr Uprichard

Q1	Q2	%age	Grade
Comment		Your key actions to take in response to this exam	

0

Use these answers to help you to learn from this exam and to identify how you might improve towards your next mock in May. The answers are taken from a range of pupils and each one earned full marks for the question. What this is then is a 100% exam paper! It can be done! Note also the comments added to help you understand **why** these answers are so good. Read it all carefully to learn how you might do better next time.

- (b) Study Fig. 5 which shows the different air masses that affect the British Isles. Answer the questions which follow.

Source: Principal Examiner

Fig. 5

- (i) Complete Fig. 5 by inserting the name of the correct air mass. [1]
- (ii) Describe and explain the temperature and moisture characteristics of a Tropical continental air mass.

It has mild and dry conditions in Winter and hot, dry conditions in Summer. It is like this because it is coming over a continent and can't pick up much moisture. High temperatures due to it coming from SE, from the equator over continents.

4

ase note: if you are wondering where figures 1 to 4 are, they are from a different question on a

- Question says 'describe and explain' i.e. what and why?
- This answer deals with both these aspects, so picks up full marks.
- Remember to read the question carefully!!

(ii) Choose **two** of the elements of the weather below and explain why these conditions were experienced in the British Isles on Wednesday 16 December 2009.

- Low temperatures
- Calm conditions
- Dry conditions

Low temperatures were experienced in the British Isles on Wednesday 16th December as an anti-cyclone was over the British Isles. So, during ~~the~~ winter anti-cyclone there is little or no cloud cover. That means that ~~more~~ radiation and heat is lost during the night. Calm conditions were experienced in the British Isles, as the isobars are far apart. So, that tells us that there was low wind speeds experienced. That means that there was little or (6) no wind.

excellent answer
- detailed & v. well
structured!

6

- Very good SCE x2 used here.
- This means that **each sentence adds detail of understanding to the answer.**
- This develops the answer, giving a full and detailed explanation.

(d) Study figure 7 which shows the world's temperatures over the past 1000 years. Answer the question which follows.

(i) Describe the temperature changes as shown in fig 7.

At the start of the past 1000 years the weather was quite cool. At the start it started to decline gradually. It declined to about -0.2 or -0.1. When the data reached the 20th century the temperatures have seemed to incline rapidly. At ~~it~~ It looks like it has reached its peak temperature at about 0.6°C.

Very good

(5)

- This answer uses the resource very well.
- It uses a **verb** and **adverb** to describe the different sections of the graph.
- It also **quotes figures**
- These are the things you should do when presented with a resource like this.

5

(ii) Explain **one** natural cause of climate change.

One natural cause of climate change is the earth's elliptical orbit around the sun may vary. Depending on how the earth orbits it could increase or decrease the world's temperatures. 2
(2)

- Both sentences add detail here.
- The first clearly identifies the cause.
- The second explains how the cause works. Two marks well earned!

(iii) With reference to a place you have studied, outline the impacts of climate change on the environment, society and economy.

Kiribati, Pacific Ocean - The effects of Climate change on a LEDC.

Environment - As the highest point in Kiribati is only 20m above sea level this acts as a major problem. The IPCC has predicted an 80cm rise in sea level by 2100 this will be a major issue for such a low lying country. Water storage is becoming a major issue as it has become contaminated by the sea water seeping through the ground. Sea water has also damaged the roads infrastructure this is a major problem as the narrowest part with a road is only 20m! connecting the main part of the island with the coral part.

Society - many inhabitants living here are becoming worried and moving⁽⁶⁾ out of the country. The current net migration movement is -2.87 Per thousand. This will become a major problem as it will be a whole nation looking for somewhere to live which will be a hard problem to overcome. More people moving out than coming in.

Economy - As Kiribati is so small and its remoteness it is a very poor country. This will have a major effect as if they are poor they will have to rely on aid from other countries, to help them if they are going to be affected. The Australian government has already given the world's bank, Kiribati's climate change adaption Project 3 million US dollars and 1 million dollars to help water storage.

- A very good case study question as it contains lots of facts. You simply will not score full marks if you don't include these.
- Also, it uses the words of the question (environment, society and economy) to provide a clear structure to the answer.
- Finally, the points are developed to show understanding. Full marks!

Unit 1 - Theme C: The Restless Earth

2 (a) Study Fig. 8 which shows the structure of the Earth. Answer the questions which follow.

(i) Write the labels for A and B in the lines below.

A inner core ✓ (1 mark)

B mantle ✓ (1 mark)

(ii) Explain why plates move.

Plates move by convection currents. The convection currents cause friction between the convection current and the bottom of the plate. As the plate colder more dense plate subducts the rest of the plate is pulled along as well (slab pull). Magma also pushes up through cracks in the crust (3 marks) and pushes the plate (ridge push).

- Very good detail of understanding communicated here.
- Geographical terms are also used to good effect.

Excellent work.

(b) Study **Fig. 9** which shows the edge of the Antrim Plateau, a lava plateau made of basalt which stretches to the north coast of Northern Ireland. Answer the questions which follow.

(i) State the rock type to which basalt belongs.

igneous. (1 mark)

(ii) Explain the formation of a lava plateau (you can use an example to help).

A lava plateau is formed when ~~a~~ lava rises up a fissure and spreads out sideways. As the lava spreads and cools it creates a large area of flat ~~topp~~ layers. These layers will eventually form ~~mountain~~ flat topped ~~layer~~ mountains, ~~for~~ for example like the Antrim Plateau.

(4 marks)

detailed &
well presented

4

- As above, very good detail of understanding communicated here.
- Geographical terms are also used to good effect.

- (c) Study **Table 1** which shows some differences between earthquakes in different places. Answer the question which follows.

Table 1

Year	Area	Country	MEDC or LEDC	Magnitude Richter Scale	Number of people killed
1964	Anchorage	USA	MEDC	8.6	130
1985	Mexico City	Mexico	LEDC	7.8	4,600
1995	Kobe	Japan	MEDC	7.2	5,500
2004	Sumatra	Indonesia	LEDC	9.0	250,000

© CCEA

Using **Table 1**, state fully **two** reasons why more people are killed in some earthquakes than others.

Anchorage had ~~more~~ ^{less} deaths than Mexico City because Mexico City is an LEDC. So Mexico City would not of been built up as well for earthquakes. This would of caused more buildings to of collapsed killing more people.

Sumatra had a larger ~~death~~ ^{death total} than Kobe because Sumatra had a larger earthquake. Sumatra had an earthquake of 9.0 and Kobe had a 7.2 on the richter scale. Sumatra's earthquake was 100 times ~~as~~ bigger. This would of killed more people.

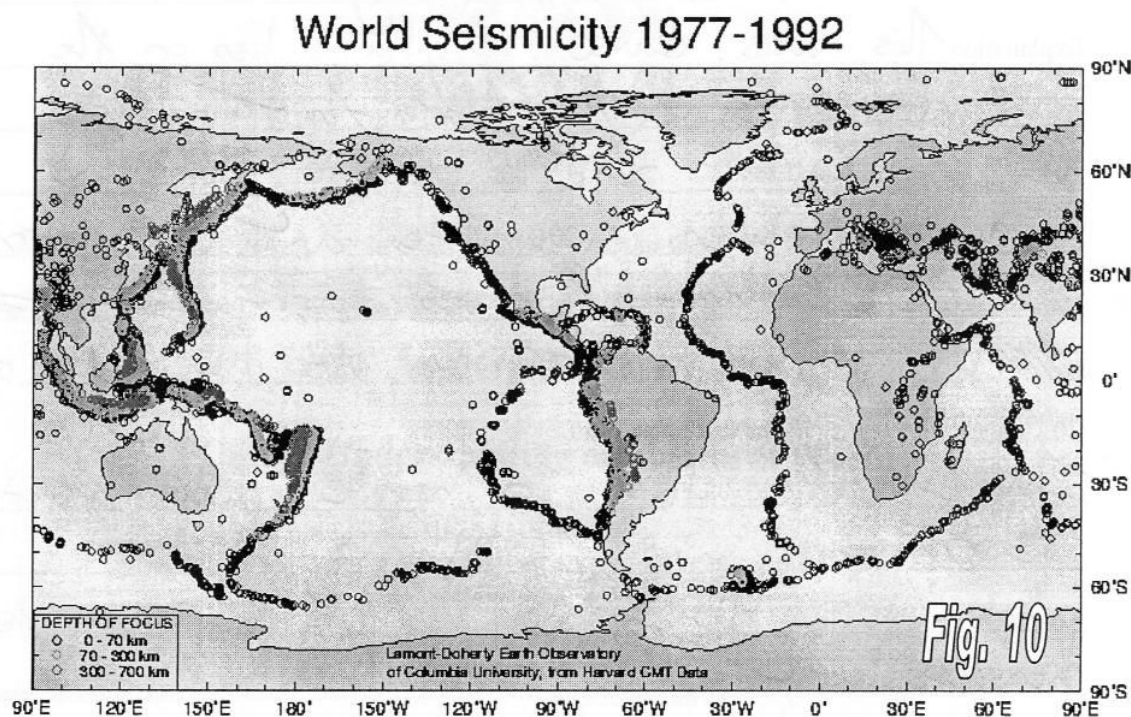

(5 marks)

9

excellent! 5

- Again, very good use of resource material (Table 1).
- The factors discussed are taken from the Table, which is vital in a question like this.
- Places are referred to and figures are quoted – don't forget to do this!

(d) Study **Fig. 10** which shows the global distribution of earthquakes (greater than magnitude 5) in 2003. Each dot is the epicentre of an earthquake. Answer the questions which follow.

(i) State the meaning of the term **epicentre**.

Epicentre is the point directly above the focus on the earth's crust so this is where the shockwaves from the impact are sent. (2 marks)

(ii) Describe the global distribution of earthquakes shown in **Fig. 10**.

The vast majority of these earthquakes are on plate boundaries. The smaller earthquakes seem to not sit on plate boundaries but the bigger, more damaging earthquakes are. The pattern of them is basically following the way the crust is broken up into plates. v. good use of resource. (4 marks)

- Very good use of resource material again here. Look at the detail drawn from the map. This person has used it very effectively.
- Earthquake distribution is linked to the plate boundaries. Many of you did this.
- But look also at the detail taken from the key about where the smaller and larger earthquakes are found. Did you notice this level of detail?

(e) (i) Explain the cause of an earthquake you have studied in an LEDC.

Location and date of earthquake Haiti 2010 ✓

Explanation Two plates were trying to slip past each other. They were moving at about 2 cm per year. When the pressure got too great, the plates suddenly slipped past each other resulting in an earthquake. Along 65 km of the fault, the ground moved ✓

3

- The question asks for the **cause**, and this answer gives the **cause**. Sounds simple, but some of you did not do this!
- A **clear understanding** of how earthquakes occur is **communicated here**.
- Notice also the **case study facts**. Must be included!

(ii) Describe **three** impacts the earthquake had.

questions carefully!

Short term impacts on people were 230,000 deaths, 300,000 injuries and hospitals destroyed ✓
Long term impacts on people were 1,000,000 people homeless and a disease called cholera broke out killing 337 people and causing 4764 confirmed cases. The disease would break out quickly by drinking dirty water and living close together in camps. ✓
Short term impacts on ~~recom~~ economy were 30,000 ~~commer~~ commercial buildings destroyed and a jail collapsed letting out 4,000 inmates. ✓

(6 marks)

- **Three impacts** asked for, **three impacts** given! Make sure you answer the question asked!!
- For each point, at least one **fact** is given.
- Also, points are **expanded appropriately** to earn the marks. Full marks here again!
